

"I don't have an integrated view of what is happening on my plant! Information is dispersed between log books and various production systems!"

"Poor communication between shifts results in problems being detected too late"

"Experienced operators leave...and their knowledge of the plant leaves with them!"

### **The Problem...**

Much of what happens on an operating plant centres on people and their interactions with each other, the process and the physical plant. While most plants are equipped with state-of-the-art plant control systems that monitor the physical plant and generate vast amounts of data about what is happening at the equipment level, there is seldom a record of the human interaction that puts this data into context and turns it into valuable information.

Day-to-day operating information is often "locked away" in production log books, meeting minutes, disparate control systems, laboratory management systems and so on. Information is not easily accessible to management and is often poorly communicated between shifts. The result is that vital information that could help to improve plant processes, prevent downtime, coordinate various departments and enhance efficiency is often lost.

### **The Opportunity...**

If summarised, relevant information about critical events and processes on your plant is made available to management and operations personnel, the opportunity exists to improve efficiency, respond timeously to potential problems, share knowledge and learning points and improve communication and coordination between departments.

Over time, this information would form an essential knowledge base to assist in measuring and improving performance, diagnosing and resolving recurring problems, and training new operations personnel.

***Delivering insight into plant operations***

FlexiLOG™ provides a highly flexible logging tool for capturing and reporting on essential operations information and communicating this information to involved parties. Tasks can be assigned to personnel to carry out critical actions and emails sent to notify people of logs requiring their action/review. The system's flexibility allows capturing of specific information relevant to your operations or to specific areas or processes and caters for a wide range of log types:

- Shift handover logs
- Batch sheets
- Call-out logs
- Meeting minutes
- Downtime records
- ...etc

"FlexiLOG™ gives me complete insight into operations on my plant - what happened during previous shifts, potential problem areas and actions required"
